June 2001

Deer Harvest in Southeast Alaska 1980-2000

2001 Deer Hunter Survey Summary Statistics

August 2000 – January 2001 season

(We include reported Unit 4 harvest data from January and doe harvest data from Prince of Wales Island in our survey even though those are federal hunting seasons.)

INTRODUCTION, METHODS, AND ANALYSIS

This is a report of the results of an annual deer hunter mail survey conducted by the Alaska Department of Fish and Game, Division of Wildlife Conservation. The survey was mailed to a sample of hunters who obtained deer harvest tickets throughout Southeast Alaska during the 2000 hunting season. We have conducted the survey since 1980 to quantify the Sitka black-tailed deer harvest in Southeast Alaska. Results of the survey contribute to management decisions and recommendations made by Region I wildlife biologists to the Board of Game. They are also used by the U.S. Forest Service to help determine how logging and other land management decisions affect deer hunting. The Federal Regional Subsistence Council and Federal Subsistence Board use these survey results when deliberating federal subsistence hunting regulation changes.

Form – The 2000 season survey form was identical to that of the previous year. As with all surveys since 1996 we did not provide a map with the survey for hunters to use in reporting their hunting sites. Instead we asked hunters to be specific in describing the locations (islands, bays, shore and/or drainages) where they hunted deer. For the fourth year we also asked if hunters participated in the state “proxy” or federal “designated hunter” programs and the number of deer they took for others under those programs.

Distribution – Not every hunter received a survey and not everyone who received one responded. Approximately 30% of the deer hunters residing in Southeast Alaska who obtained deer harvest tickets were sent surveys.

Response – The overall response rate of those who received surveys was 61%. Because response rates varied by community, the responses received from each community were multiplied by an expansion factor to calculate estimates for hunters possessing deer harvest tickets in the community. The higher the sample fraction and percentage of responses from a community, the lower the expansion factor. And, the higher a community's response rate, the better these data represent actual hunting effort and success of all hunters with deer harvest tickets in that community.

This year's overall response rate was the highest since we began mail surveys in 1980. Although the continued good overall response rate is encouraging, annual response rates from many small communities, such as Angoon, Coffman Cove, Hoonah, Hydaburg, Kake, Klawock, Metlakatla, Meyers Chuck, Pelican, Naukati Bay, Port Alexander, and Whitestone Camp are too low. The continued low response rates from many rural areas reduce our confidence in the ability of the survey to accurately describe actual deer hunting effort and success in parts of Southeast Alaska. Response from Ketchikan and Sitka has also been below the regional average for the past few years.

Kill location – Along with an increased survey response rate, the percentage of hunters who described kill location specifically enough for us to assign it to a Game Management Unit (GMU), island, major hunt area, or Wildlife Analysis Area (WAA) was the same as last year. When kill location was not identified specifically enough to assign to a GMU, island, major hunt area, or WAA, we report them as “unknown” or “missing” in the summary. In the past, when hunters were provided a map to code hunt locations, 99% of responding hunters reported hunt locations down to the scale of WAA. In the 2000 survey, without a map, the percentage of hunters who gave detailed enough information for us to code hunt locations to GMUs was 99.7%. For coding to islands it was 99%. The percentage giving enough detail to code to major hunt areas remained 98%; the percentage of those providing sufficient information for coding to WAAs remained 97% in 2000.

Results – Results this year were significantly different from previous years' in regard to harvest and hunting activity on Prince of Wales Island (POW). In the 2000 season, we estimate a POW harvest about 15% higher than the past 10 years' average with 300 more POW hunters than in previous years. Almost all of this increase can be attributed to a 42% increase in the number of hunters reported from the community of Craig. Whether this represents an actual increase in the number of Craig hunters or more complete information on the number of deer harvest tickets issued by license and harvest ticket vendors is unknown. If the latter, hunter and harvest numbers for areas hunted by Craig residents have likely been underestimated in recent years.

Total deer harvest for the 2000 season is estimated to be 10,547, a decrease of about 470 (4%) from the previous season and 2200 (18%) less than the average for the previous 19 years. Hunter numbers of 7981 were slightly higher than last year and slightly lower than the long term average of 8120. The average hunter spent 5.8 days hunting this year, near the long-term average of 6 days. Hunters bagged a deer every 4.4 days afield, less often than the long-term average of 3.8. The total number of hunter days afield (46,000) increased for the third straight year but remains 5% below the long-term average. Hunters' success rate declined to 58% in 2000, 4% below the long-term average. The average number of deer killed per hunter was 1.3, slightly less than the long-term average of 1.6.

Regionwide, 42% of the deer harvest was taken by hunters using highway vehicles or ATVs. That is up from the 36% using motorized road vehicles in 1999 and just 31% in 1998. The percentage of deer harvested by boat hunters declined from 53% in 1999 to 48% in 2000. This trend toward road vehicle harvest is fueled by the increasing harvest in recent years from roaded areas in GMU 2, primarily Prince of Wales Island, while harvest in mostly boat-accessible areas of GMU 4 has been declining. Hunters using airplanes took 8% of deer in 2000 the same as the previous 2 years.

The lower regional harvest total may be due to multiple factors. Hunter success and days afield may have been reduced by unusually mild fall and early winter weather which allowed deer to remain at higher elevations and more dispersed throughout the 2000 hunting season. Apparent lower deer densities in some areas of southern Southeast may also be responsible for lower deer harvests.

Several hunters reported harvesting large numbers of deer, mostly does, during very short time periods. For instance, one respondent reported taking 20 does in one day of hunting and a total of 38 deer in 4 days. Although such an achievement is possible, it is extremely unlikely and cannot properly be expanded to the hunting population as a whole. Consequently, the responses of these “statistical outliers” (those reporting more than 4 deer taken per day) were not included in the data analyzed for survey results. Even though the survey asks hunters to report only deer they killed themselves, some hunters may have been reporting deer seen while hunting or total deer killed by the party they hunted with.

Proxy and designated hunters – The number of hunters reporting as state “proxy” or federal “designated” hunters was slightly fewer in 2000 than in 1999. However, they reported taking almost 25% more deer and had a higher success rate. We estimate 191 state proxy hunters from 13 communities took a total of 287 deer with a 64% success rate in 2000. That compares with about 197 hunters, 233 deer and a 54% success rate in 1999. Year 2000 reporting proxy hunters came from the following Southeast communities: Angoon, Craig, Game Creek, Haines, Hollis, Hoonah, Juneau, Ketchikan, Klawock, Meyers Chuck, Petersburg, Sitka, and Wrangell.

We estimate about 196 federal designated hunters from 10 communities took 397 deer with a 77% success rate. That compares with 215 hunters from 9 communities reporting 321 deer and a 56% success rate in 1999. Year 2000 reporting designated hunters came from the following Southeast communities: Craig, Gustavus, Haines, Hoonah, Juneau, Ketchikan, Petersburg, Sitka, Thorne Bay, and Wrangell.

Weather - Weather during the 2000 Southeast Alaska deer hunting season was warm and wetter than normal but not as inclement as the previous year. Snowfall was unusually light, well below normal at low elevations but near normal at high elevations throughout the winter. Snow cover was restricted to high elevations through January, which likely depressed harvest even for late season subsistence hunters. Anecdotal comments from some hunters in northern Southeast suggest that fewer hunters than usual went afield after Thanksgiving. Many were waiting for “a big snow” to drive deer to lower elevations. Only 14% of the season’s total harvest in GMU 4 came in December whereas December harvest in the unit usually averages about 20%. In GMU 1C, December 2000 harvest was 12% of the season total compared to 20% the previous year.

Because of the lack of persistent snow cover at low elevations, the winter of 2000/01 can be described as very mild in terms of its probable effects on the deer population. Pellet-group surveys completed after the hunting season in spring 2001 found deer densities higher in northern and central Southeast Alaska, showing some evidence of rebounding from the effects of the severe winter of 1998/99. Pellet-group densities in southern Southeast on the other hand were notably lower especially on Prince of Wales Island and the Cleveland Peninsula. Because we have had two consecutive years of mild winter weather, it is not clear what factors are responsible for the decline in southern Southeast.

Results by Game Management Unit

GMU 1A (Revillagigedo and Gravina islands, Cleveland Peninsula, and Misty Fjords mainland) – Estimated total unit harvest of 267 was slightly lower than last year and less than half the long-term average for the unit (580). The overall hunter success rate for GMU 1A was only 26%, considerably below the regional rate of 58%. Gravina Island hunter numbers and harvest were similar to 1999 and only about 25% of the long-term average for the island. Reported hunter success rate on Gravina was again only 13%, far lower than anywhere else in Region I except the mainland, and hunters spent 18 days afield for every deer taken.

The decline in the Cleveland Peninsula harvest from 59 deer in 1999 to 11 deer in 2000 was the fifth year of declining harvest in the past 6. Deer were reported taken only at Vixen Inlet and Port Stewart areas. Pellet-group surveys in spring 2001 indicate the deer densities in drainages on the east side of the Cleveland remain very low and are only 25–30% of what they were a decade ago. The hunter kill was only 8% of the previous 10 years’ average (140).

Number of hunters using Revilla Island declined for the second consecutive year but reported hunter days increased, as did the hunter success rate (27%), and the harvest was up by 9% from the previous year. Revilla hunters still spent 14 days afield for every deer taken, however. Boosting that statistic was the futility reported by those using highway vehicles who spent 36 days afield for each deer bagged. Boat hunters fared better spending 10 days afield per deer. Only 21% of Revilla’s deer harvest came from road-based hunting.

GMU 2 (Prince of Wales and neighboring islands) – Harvest on Prince of Wales (POW) is estimated at 2770 deer, 15% higher than the long-term average. Reported harvest of does (231) was slightly higher than the previous season and the highest annual reported doe harvest. Hunter days on POW totalled 13,160, increasing for the second consecutive year.

Craig and Hollis hunters’ reported harvests were over 300 deer more than last year and those communities accounted for most of the reported harvest increase on POW. The increases were also reflected in areas most hunted by people from those communities, central and northcentral POW. The area in which Ketchikan hunters expended the most effort and reaped their highest harvest also shifted from northern POW in 1999 to central and northcentral in 2000. As a result, reported harvest in the Craig/Klawock/Thorne Bay area of central POW increased significantly for the third straight year to 1254. Northcentral POW (Staney Creek – Coffman Cove) was up slightly. Harvest was slightly higher than 1999 on northeast POW and slightly lower on northwest POW. Ketchikan hunters’ share of the reported deer kill on POW was 26%, equal to the average of the past 3 years. Because of higher reported harvest from Craig, Klawock, Hydaburg, and Ketchikan, harvest on southwest POW more than doubled (112) the 1999 total. In southeast POW, reported harvest dropped slightly from 120 to 107 deer.

The number of hunters (2150) on POW was 17% (220) higher than the previous year. The success rate remained stable at 63% and hunters spent an average of 6 days in the field, one less than in 1999. 77% of the harvest in GMU 2 comes from hunters using highway vehicles or ATVs as their main mode of transport compared to 42% for the entire region.

On Heceta Island, 54 deer were reported taken continuing the trend of declining harvest begun the previous year. Hunter success was very high, however, with 100% of hunters reporting killing a deer, taking an average of 2 per hunter, and spending only 2 days afield for each deer taken. Harvest was higher on other Unit 2 islands compared to 1999 including, Dall and Long islands, Sumez Island, the “Outer” islands (including Noyes, Baker, and Lulu), and Tuxekan and other islands of Sea Otter Sound.

GMU 1B and 3 (central mainland and islands) – Deer harvest on the central mainland (GMU 1B) in 2000 was half of what it was in 1999. The total of 44

deer was also half the long-term average. All harvest reported came from the Thomas Bay area. The GMU 3 harvest of 1060 deer was 30% higher than the average since 1993 when all of Unit 3 was open for deer hunting.

In Unit 3, the Zarembo Island harvest of 430 was the highest ever and again supplied about half of Wrangell hunters' total harvest for the year. The Wrangell Island harvest topped 100 for only the second time since the 1980s. Harvest on Mitkof Island (169) was up 25 deer from the previous season and also 25 more than the long-term average for the island. The kill on Kupreanof Island (249) was slightly lower than the previous season but for the first time provided more deer for Petersburg residents than Mitkof Island. Since hunting was resumed on Kupreanof in 1993 the annual average harvest has risen to over 200 deer. The percent of the harvest in GMU 3 that comes from hunters using highway vehicles or ATVs as their main mode of transport remained above 50% for the third consecutive year.

GMU 1C (northern mainland, Douglas, Shelter, and Lincoln islands) – Estimated harvest on Douglas Island was 153 deer, lowest since the early 1980s and the fourth straight season decline. Percentage of bucks in the harvest was 67%; an increase over the previous year's 58%. The estimated number of hunters and hunter days dropped for the second year to 616 (4% decline) and 1661 (8% decline) respectively. Because of its proximity to Juneau hunters and having road access to about half the island, Douglas is consistently the most heavily hunted island per square mile in Southeast Alaska. It ranks seventh in number of reported hunter days per island behind the much larger islands Prince of Wales, Chichagof, Admiralty, Baranof, Revillagigedo, and Zarembo. Douglas' hunter success rate of 19% was second lowest of all islands, bettering only Gravina (13%). Douglas hunters spent 11 days afield for each deer harvested, 4 more than 1999. Only hunters on Gravina (18), Wrangell (13), and Revillagigedo (11.5) spent more days afield per deer.

The percentage of the harvest on Douglas by hunters using highway vehicles as their main mode of transport continued to decline to 46% from a high of 70% in 1998. This suggests hunters are having less success in the road-accessible areas of the island. Lack of late season snow may have influenced hunter success by allowing deer to remain farther from the mostly low-elevation road system. Spring 2001 surveys found relatively low but stable pellet-group density on the north (roaded) side of Douglas Island.

Harvest on Shelter and Lincoln islands was about the same as 1999 and slightly lower than that of the previous two seasons. Percentage of does taken from those islands declined from the previous year to a more desirable 29% of the harvest. Spring 2001 pellet-group surveys indicated Shelter Island had the second highest deer density of all areas sampled in Southeast Alaska this year.

GMU 4 (ABC and neighboring islands) – Estimated harvest was down 13% for the unit compared to 1999 and 30% below the long-term average. Admiralty and Kruzof islands' harvests were similar to last year's. The Kruzof harvest of 335 was slightly higher than the long-term average for the island. Baranof and Chichagof islands' harvests were down about 20% from the previous year. Yakobi Island harvest was up.

The Chichagof/Yakobi kill was an estimated 2205, an decrease of about 17% (466 deer) from 1999. That is 500 deer, or 20%, below the long-term average. Yakobi Island harvest at 65 deer was more than double last year's total. Most of the decrease in Chichagof Island harvest came from the Peril Straits area, Ushk Bay/Hoonah Sound to Sitkoh Bay on south Chichagof where harvest (315 deer) was only 40% of 1999. Lower harvest was also reported on west and north Chichagof Island, but harvest on the Northeast Chichagof road system and the south shore of Tenakee Inlet increased. Although the number of hunters on Chichagof/Yakobi was the same as the previous year, hunter days increased 13%. Most of that increase was due to Hoonah hunters who reported 1,000 more days afield on Chichagof than last season, an 80% increase. Hoonah hunters reported 28% more deer taken on Chichagof with 72% of that harvest coming from the road system on Northeast Chichagof. A hundred more Juneau hunters reported hunting Chichagof/Yakobi this season, but they spent the same number of days afield and took the same number of deer (660) as in 1999.

For the second straight year the estimated Baranof Island harvest was almost 20% lower than the previous season. The harvest of 1583 deer was 32% below the long-term average. Lower harvests were reported in Peril Strait (where harvest was half of 1999) and southwest Baranof. Harvest around Sitka Sound and northeast Baranof was slightly higher than last season. A hundred more hunters spent 1,000 more hunter days on Baranof in 2000 than in 1999 and killed almost 400 fewer deer. As a result, hunters spent over 3 days afield for every deer bagged compared to 2 days per deer in 1999.

Sitka hunters reported taking about 1,000 fewer deer in 2000 than their annual average, a decrease of 30%. Greatest decline came in the Chichagof Island harvest where they reported 750 fewer deer from Peril Strait and West Chichagof. Mild weather may have enabled deer to keep well inland from the beaches in those areas and less accessible to hunters.

Admiralty Island's 2000 harvest of 1696 deer was nearly identical to 1999's harvest and 30% lower than the 10-year average. Hunter numbers (1350) were similar to the previous year and the 3.3 days per deer average in 2000 for each deer killed was also similar to 1999. Not all areas remained unchanged. Harvest on north Admiralty was slightly higher than 1999, whereas west Admiralty harvest was down about 20%. In the Gambier-Pybus-Eliza area of south Admiralty and in Seymour Canal harvest equaled the 1999 totals.

Spring 2001 pellet group surveys in GMU 4 found densities varied compared to previous years in the areas surveyed – north Chichagof and Yakobi Island higher, west Chichagof slightly lower, northwest Baranof and north Kruzof stable. During deer mortality transects in spring 2001 no carcasses were found along 5 one-mile transects on beaches in Sitka Sound and Peril Strait. In addition during the transects, a large number of deer, all appearing to be in excellent physical condition, were seen on the beaches.

Outlook – In northern Southeast Alaska, thanks to two consecutive mild winters in 1999/00 and 2000/01, deer numbers appear to be rebounding somewhat from the effects of the severe 1998/99 winter. Hunters should encounter plenty of deer during the 2001 season. Spring 2001 pellet-group surveys suggest deer numbers are stable in central Southeast but lower in the south. Hunters on Prince of Wales Island had good success last season but elsewhere in southern Southeast harvest was down. Despite biologists' field observations of abundant deer on Prince of Wales Island, pellet-group surveys indicate declining deer densities in six of the seven drainages surveyed. Until we know more about the reasons for low and declining deer pellet-group densities in most areas of southern Southeast despite the mild winters, it is difficult to predict the hunting outlook. Based on our current information, it appears hunters may continue to have low success rates in many areas of southern Southeast Alaska during the 2001 season.

January 2001

Dear Southeast Alaska Hunter:

Attached is our 2000/2001 deer hunter survey. We are sending it to a random selection of deer hunters who picked up deer harvest tickets for this past hunting season. Please invest a few minutes of your time to help manage Alaska's deer. **We really need your answer even if you did not hunt.**

The information you provide is essential to good deer management. In addition to harvest, questionnaire responses tell us what hunting areas are important to each community. Your knowledge and familiarity with the areas you hunt help us understand how local deer populations are doing and how deer hunting will be affected by other resource uses.

This year, in addition to asking you to report where you killed deer, we also would like to know where you hunted and were unsuccessful. We ask that you write in the name of the specific location of each hunting trip -- the bay, shore (N, S, E or W), stream drainage, and island or mainland area where you hunted. Please be as specific and accurate as you can. The more detailed the information you provide, the more confident we can be about what deer hunting areas are important to each community.

ADF&G Division of Subsistence will also be surveying deer hunters in some communities in Southeast Alaska this winter. If you participate in that survey, we ask that you also send in your response to this mail survey. Even though the surveys ask similar questions their objectives are somewhat different.

Survey results in summarized form are used by the Alaska Board of Game and the Federal Subsistence Board to set seasons and bag limits, and make other hunting regulations such as allocations to communities. In addition, the U.S. Forest Service uses the summarized data to help make decisions about what areas will be logged. Those who respond to the survey help make management decisions in areas important to them.

We plan to send summary results of the survey to all who respond whether you hunted or not. Thanks for your continued cooperation.

Sincerely,

Kim Titus
Regional Supervisor
